

8. Given a 2.00 L saturated solution of  $\text{Cu}(\text{IO}_3)_2$ ,  $K_{sp} = 1.4 \times 10^{-7}$ , how many moles of  $\text{NaIO}_3$  would need to be dissolved in solution to reduce  $[\text{Cu}^{2+}]$  to  $6.0 \times 10^{-5} \text{ M}$ ? (Assume the added  $\text{NaIO}_3$  does not appreciably change the total volume of solution.)

$$K_{sp} = [\text{Cu}^{2+}][\text{IO}_3^-]^2 = (6.0 \times 10^{-5})[\text{IO}_3^-]^2 = 1.4 \times 10^{-7}$$

$$[\text{IO}_3^-] = \sqrt{\frac{1.4 \times 10^{-7}}{6.0 \times 10^{-5}}} = 0.048 \text{ M } \text{IO}_3^- \times 2.00 \text{ L} = 0.097 \text{ mol } \text{IO}_3^-$$

$$0.097 \text{ mol } \text{IO}_3^- \times \frac{1 \text{ mol } \text{NaIO}_3}{1 \text{ mol } \text{IO}_3^-} = \boxed{0.097 \text{ mol } \text{NaIO}_3}$$

**Even more practice!**

9. Copper(I) bromide has a measured solubility of  $2.0 \times 10^{-4} \text{ mol/L}$  at  $25^\circ\text{C}$ . Calculate its  $K_{sp}$  value.

$$K_{sp} = [\text{Cu}^+][\text{Br}^-] = x^2 = (2.0 \times 10^{-4})^2 = \boxed{4.0 \times 10^{-8}}$$

10. The  $K_{sp}$  value for copper(II) iodate,  $\text{Cu}(\text{IO}_3)_2$ , is  $1.4 \times 10^{-7}$  at  $25^\circ\text{C}$ . What is the maximum mass, in grams, of copper (II) iodate that can dissolve in 500. mL of water?

$$K_{sp} = [\text{Cu}^{2+}][\text{IO}_3^-]^2 = x(2x)^2 = 4x^3 = 1.4 \times 10^{-7}$$

$$x = \sqrt[3]{\frac{1.4 \times 10^{-7}}{4}} = \underbrace{3.271 \times 10^{-3} \text{ M}}_x \times 0.500 \text{ L} = 1.636 \times 10^{-3} \text{ mol } \text{Cu}(\text{IO}_3)_2 \times \frac{413.37 \text{ g}}{1 \text{ mol}} = \boxed{0.68 \text{ g } \text{Cu}(\text{IO}_3)_2}$$

11. In pure water at  $25^\circ\text{C}$ , the molar solubility of  $\text{PbCl}_2$  is  $1.3 \times 10^{-6}$  and the  $K_{sp}$  is  $1.6 \times 10^{-5}$ .  $\text{LiCl}$  is added to 5.00 L of a saturated solution of  $\text{PbCl}_2$  at  $25^\circ\text{C}$  until the  $[\text{Pb}^{2+}]$  is reduced to  $4.5 \times 10^{-4} \text{ M}$ . How many moles of chloride ions are dissolved in solution at the point when  $[\text{Pb}^{2+}] = 4.5 \times 10^{-4} \text{ M}$ ? (Assume the added  $\text{Ca}(\text{NO}_3)_2$  has a negligible effect on the total volume of solution.)  $\text{LiCl}$

$$K_{sp} = [\text{Pb}^{2+}][\text{Cl}^-]^2 = (4.5 \times 10^{-4})[\text{Cl}^-]^2 = 1.6 \times 10^{-5}$$

$$[\text{Cl}^-] = \sqrt{\frac{1.6 \times 10^{-5}}{4.5 \times 10^{-4}}} = 0.19 \text{ M } \text{Cl}^- \times 5.00 \text{ L} = \boxed{0.94 \text{ mol } \text{Cl}^-}$$

## Multiple Choice Practice!

Use the following information to answer questions 12–14.

150 mL of saturated  $\text{SrF}_2$  solution is present in a 250 mL beaker at room temperature. The molar solubility of  $\text{SrF}_2$  at 298 K is  $1.0 \times 10^{-3}$  M.

12. What are the concentrations of  $\text{Sr}^{2+}$  and  $\text{F}^-$  in the beaker?

- a.  $[\text{Sr}^{2+}] = 1.0 \times 10^{-3}$  M;  $[\text{F}^-] = 1.0 \times 10^{-3}$  M  
 b.  $[\text{Sr}^{2+}] = 1.0 \times 10^{-3}$  M;  $[\text{F}^-] = 2.0 \times 10^{-3}$  M  
 c.  $[\text{Sr}^{2+}] = 2.0 \times 10^{-3}$  M;  $[\text{F}^-] = 1.0 \times 10^{-3}$  M  
 d.  $[\text{Sr}^{2+}] = 2.0 \times 10^{-3}$  M;  $[\text{F}^-] = 2.0 \times 10^{-3}$  M

$$[\text{Sr}^{2+}] = x = 1 \text{E-}3$$

$$[\text{F}^-] = 2x = 2 \text{E-}3$$

13. What would be the effect on  $[\text{Sr}^{2+}]$  if some  $\text{NaF(s)}$  was added to the beaker?

- a.  $[\text{Sr}^{2+}]$  would remain unchanged; neither ion in  $\text{NaF(s)}$  is common to  $\text{Sr}^{2+}$   
 b.  $[\text{Sr}^{2+}]$  would increase; more  $\text{Sr}^{2+}$  ions would be needed to balance the additional  $\text{F}^-$  ions to re-establish equilibrium.  
 c.  $[\text{Sr}^{2+}]$  would decrease; the additional fluoride ions would cause the system to shift left to re-establish equilibrium.  
 d.  $[\text{Sr}^{2+}]$  would decrease; the additional  $\text{Na}^+$  would cause an excess of positive charge, and the system would shift left to reduce overall positive charge.

14. Calculate the solubility product for  $\text{SrF}_2$  at 25°C.

- a.  $2 \times 10^{-9}$       c.  $4 \times 10^{-9}$   
 b.  $2 \times 10^{-6}$       d.  $4 \times 10^{-6}$

$$K_{sp} = [\text{Sr}^{2+}][\text{F}^-]^2$$

$$= x(2x)^2 = 4x^3$$

$$= 4(1 \text{E-}3)^3$$

$$= 4 \text{E-}9$$
